

What is it and how does it

The SaFTFlo® Squeeze Dose System is a simple dilution control system offering an alternative when wall-mounted dispensing systems are not possible.

Designed to work with the SaFTFlo® closed-loop system, the Squeeze Dose works by attaching to any bottle fitted with the SaFTFlo® insert. Like the cap adapter, the squeeze dose system acts as a key and opens the valve of the bottle insert, allowing for chemical dispensing. Once attached to the chemical container, the end-user simply squeezes the container, so the chemical concentrate dispenses into the cup at a pre-set dose.

Once the dose has been squeezed out of the bottle, simply, flip open the dosing cup's lid of the dosing cup and pour the concentrate into the mop bucket, spray bottle, or other cleaning containers. It does not need to be plumbed in or connected to a water supply.

Benefits

- Cost-effective
- Simple, safe, easy to use
- Eliminates mixing mistakes

Key Features

- Dose amounts from 15 to 60 millilitres
- Logo printing/branding available
- Fits 38mm bottles
